Summary

Jahnavi Yerram comes with 7 years of experience in IT working with heavily as a Full Stack developer and gaining a significant amount of time working with frontend technologies such as react and Angular on various application in Finance, retail Java, Spring, Spring Boot, Requirement Gathering, Analysis, Developing, Testing, and implementing life cycles utilizing approaches like Agile, Scrum, Waterfall, and Test-Driven Development (TDD).

Technical Skills

JAVA/J2EE Technologies	Java 8+, J2EE (Servlets, JSP, EJB, JavaBeans, JDBC, JMS, JPA, JNDI, JAX-WS, JAX-RS), MVC, Struts
Programming Languages	C, C++, Java 8, SQL, PL/SQL
Messaging Servers	ActiveMQ, RabbitMQ, Kafka
Web Technologies	JavaScript, AngularJS, Backbone JS, XML, HTML5, CSS3, XHTML, XML Schema, DHTML, JSON RPC, AJAX, jQuery, WebSocket, Knockout JS, React, React js, Vue JS, Angular JS, Typescript, XSL, XSLT, SED, DTD.
Databases	MySQL, Entity Framework, Oracle, MS SQL Server, DB2, Cassandra, PL/SQL, MongoDB, Hadoop, DynamoDB, Couchbase.
Web/App. Server	Oracle WebLogic Application Server, IBM WebSphere Application Server, Apache Tomcat Webserver, JBoss Application Server
Architectures	EJB, Multi-Tier Enterprise Application, JDBC, Extreme Programming (XP), and Continuous Integration (CI)
Web Services	SOAP, Restful, JAX-B, JAX-RS, WSDL, AWS, Apache Axis, XML, XHTML, XSLT, and JAX-WS
Frameworks	Struts, JSF, Hibernate, Spring, Junit
Version Control Tools	GitHub, CVS, SVN, Rational Clear Case, SubVersion
IDE/Tools	Eclipse, RAD, NetBeans, IntelliJ, RAD, ANT, Maven, Jenkins, Bugzilla, JIRA, Rational Rose, RSA, Spring Tool Suite, Android Studio, JBoss Developer Studio, Jenkins for CI/CD
SDLC	Agile - Scrum, Waterfall
Build and Performance Managing Tools	Ant, Maven, Gradle, Jenkins, JIRA
Testing	Junit, TestNG, Jasmine, Selenium, Mockito, Power Mockito, Cucumber
Design Patterns	MVC, Intercepting Filter , Front Controller , Session Facade , Business Delegate, DTO, DAO, Service Locator

Professional Experience

Senior Full Stack Developer

Jan 2024 – Present

Acuity Brands, Atlanta, GA

Project description: At **Acuity Brands**, I worked on the development of an externally facing web application used to manage product configurations, pricing data, and customer-facing workflows for intelligent lighting and building management solutions. The application enabled users to register, manage profiles, configure products, submit data inputs, and view dynamically calculated results such as pricing estimates, configurations, and status summaries. The platform provided a unified and trackable view of user data, configurations, and system outputs. The frontend was built using modern JavaScript frameworks with responsive UI design, while the backend services were developed using Java, Spring, and Spring Boot to support scalable and secure business operations.

Frontend: Focused on delivering a seamless and intuitive customer experience through a modern **single-page application (SPA)** architecture. The frontend leveraged **component-based frameworks (ReactJS and Vue.js)** to ensure responsiveness, usability, and maintainable state handling.

- Built responsive UI screens using **ReactJS, Vue.js, TypeScript, JavaScript, HTML5, CSS3, and Bootstrap**.
- Designed and integrated **REST-based communication** between the frontend layer and Java backend services using **Spring Boot APIs**, ensuring secure and reliable data exchange.
- Implemented asynchronous data interactions using **Axios / Fetch APIs** to retrieve and submit customer and configuration data, keeping the UI responsive during backend processing.
- Structured application navigation using **client-side routing** to enable smooth transitions across onboarding, configuration, pricing/estimation, and summary views.
- Managed shared application state using **Redux** (and centralized state patterns) to keep user, product, and pricing data consistent across multiple UI components.

Backend

- Built **RESTful microservices** using **Java, Spring Boot, Spring MVC, and Spring Data** to support core business workflows and calculations.
- Implemented asynchronous processing using **messaging queues (SQS)** for background tasks and data updates.
- Developed scheduled jobs using **Spring Scheduling** to automate recalculation, validation, and synchronization processes.

Cloud

- Deployed services on **AWS EC2**, ensuring scalability and high availability.
- Utilize **AWS S3** for secure storage of static assets and application files.
- Configured **AWS IAM** roles and policies for secure access control.
- Monitored system health using **AWS CloudWatch**, creating dashboards and alerts.
- Supported CI/CD pipelines using **Jenkins, Maven, and Git**.

Environment: Spring Boot, Spring MVC, Spring Cloud, Spring Data, Hibernate, ReactJS, Vue.js, Redux, TypeScript, HTML5, CSS3, Bootstrap, JavaScript, REST, JSON, SOAP, WSDL, MySQL, Oracle, MongoDB, AWS (EC2, S3, IAM, CloudWatch, SQS), Jenkins, Maven, Gradle, Git, Tomcat, Jira

Project description: Worked on a customer-facing digital platform at T-Mobile supporting subscriber account management and end-to-end service lifecycle operations. The application enabled customers to onboard, manage plans, activate services, track usage, update billing details, and maintain account information. The platform was built using a **modern Angular single-page application (SPA)** on the frontend and **Java Spring Boot microservices** on the backend to support high-volume telecom workflows with scalability and reliability.

Frontend

- Built responsive **single-page application (SPA)** features using **Angular (TypeScript), HTML5, and CSS3** for customer profile, service management, and subscription workflows.
- Developed reusable **Angular components, services, and modules** to ensure maintainable and scalable frontend architecture.
- Used **Angular HttpClientModule** to integrate RESTful backend APIs for secure retrieval and submission of customer and service data.
- Implemented client-side validation, dynamic UI updates, and state handling to improve user experience and reduce backend dependency.

Backend

- Developed **RESTful APIs** using **Java 8, Spring Boot, and Spring MVC** to support account updates, service provisioning, and subscription lifecycle management.
- Used **Hibernate and JPA** for efficient data persistence and retrieval from **SQL Server** databases.
- Enforced request validation, business rules, and error handling to maintain data integrity and telecom compliance.
- Implemented **global exception handling and standardized API error responses** using Spring Boot to ensure consistent error messaging, easier debugging, and predictable behavior for frontend and downstream consumers.

Cloud:

- Deployed backend **Spring Boot microservices** on cloud infrastructure using **containerized and managed compute services**, enabling scalability, high availability, and reliable handling of variable telecom traffic loads.
- Hosted and delivered frontend **Angular SPA assets** using **cloud-based static hosting and CDN services**, ensuring fast load times and consistent performance for users across different regions.
- Configured and managed **cloud Identity and Access Management (IAM)** roles and policies to enforce secure service-to-service communication and protect sensitive customer data.
- Integrated **cloud monitoring and logging services** to track application health, API performance, and error trends, enabling proactive issue detection and faster production troubleshooting.

Environment: Java 8, Spring Boot, Spring MVC, Hibernate, JPA, **Angular (TypeScript)**, HTML5, CSS3, REST, Microservices, Kafka, SQL Server, GitHub, Jenkins, Swagger, Log4j, Jira, AWS/GCP, JSON, DOM, GraphQL

Project description: At **Old National Bank**, contributed to the development of a customer-facing financial management and reporting application used to support retail and commercial banking operations. The platform enabled internal users and customers to track account activity, monitor inflows and outflows, analyze financial performance across accounts, and perform year-over-year comparisons for better financial decision-making. The application supported detailed views into balances, transactions, and account summaries while maintaining compliance with banking standards. Frontend development was primarily handled using React, HTML, and CSS, while backend services were built using Java, Spring, and Spring Boot to support secure and scalable banking workflows.

Frontend development description: In a recent project with Old National Bank, I worked on a financial services web application that provided interactive dashboards and reporting features for account and transaction analysis. The frontend was developed using React to deliver a responsive single-page application, with Redux used for centralized state management across complex financial views. The application supported dynamic data visualization and secure user interactions tied to backend banking services. The platform was deployed in a cloud environment to ensure high availability and scalability. To maintain code quality and security standards, the project incorporated automated testing, authentication mechanisms, and CI/CD pipelines.

- Developed dynamic web pages using JSP (JavaServer Pages) to render server-side financial data and integrate seamlessly with backend REST APIs.
- Designed responsive and accessible user interfaces using CSS3 to ensure consistent user experience across desktop and mobile devices.
- Utilized the Struts framework to manage request flow and navigation within the frontend application, supporting structured interaction patterns.
- Integrated frontend components with backend services built using Java, Spring Boot, Hibernate, and Cassandra to retrieve and display account, transaction, and financial summary data.

Backend:

- Developed RESTful APIs using Java, Spring Boot, and Hibernate to support retrieval and processing of account, transaction, and financial reporting data.
- Leveraged Cassandra as a distributed data store to handle high-volume financial records while ensuring scalability and availability.
- Implemented full CRUD operations to allow secure creation, retrieval, updates, and deletion of financial records in accordance with business rules.
- Added validation, exception handling, and logging mechanisms to maintain data integrity, enforce banking constraints, and provide meaningful error responses.

Cloud duties:

- Deployed backend services and frontend applications on AWS infrastructure using services such as EC2 and Elastic Beanstalk to ensure scalability and reliability.
- Configured AWS Identity and Access Management (IAM) to enforce secure authentication and authorization for accessing cloud and application resources.
- Implemented AWS Lambda functions to support event-driven processing and background financial data operations, reducing infrastructure overhead.
- Used Amazon CloudFront as a CDN to deliver static frontend assets efficiently and reduce latency for geographically distributed users.
- Monitored application performance and system health using AWS CloudWatch, setting up alerts and dashboards to proactively detect operational or security issues.

Environment: Java, Spring Boot, Spring MVC, Hibernate, JSP, HTML5, CSS3, JavaScript, ReactJS, Redux, Struts, Cassandra, Oracle, Redis, AWS (EC2, Lambda, CloudFront, IAM, CloudWatch), REST APIs, Microservices, OAuth, Kafka, Swagger, Spring Cloud, Spring Data JPA, PL/SQL, XML, JSON, Log4j, Mockito, Jira, Git, Jenkins, SNS

Project Description: Worked on a **client-facing enterprise application** delivered by eClerx for a financial services customer. Designed and enhanced application security by implementing authentication and authorization mechanisms using OAuth and OpenID Connect, along with automated vulnerability scanning through OWASP ZAP. With guidance from senior team members, integrated SAML-based authentication to support secure identity federation and access control. Contributed to performance improvements by tuning Java, Spring Boot, and Hibernate-based database interactions, and supported UI development using HTML, CSS, and JSTL to deliver a consistent and user-friendly experience.

Frontend

- Developed clean and responsive user interfaces using HTML, CSS, and JSTL to deliver a consistent and engaging user experience across different devices and screen sizes.
- Leveraged JSP (Java Server Pages) to dynamically render content, enabling real-time data flow between the Java backend and the user interface.
- Used XSL transformations to convert XML-based data into structured and readable HTML views, supporting flexible presentation and customization needs.
- Applied structured CSS styling techniques to ensure uniform layout, visual consistency, and adherence to UI standards across the application.

Backend

- Actively participated in all phases of the Software Development Life Cycle (SDLC), from requirement analysis and design through development and deployment, gaining end-to-end project exposure.
- Implemented and optimized Hibernate HQL queries along with database stored procedures to support efficient data access and processing within DB2 and SQL Server environments.
- Assisted in build and deployment activities using Maven and SVN, ensuring reliable version control and streamlined application releases.
- Automated backend data processing tasks using Python scripts to handle file validation, data segregation, and transformation workflows, reducing manual effort. Contributed to unit testing, module testing, and integration testing activities to maintain application stability, and supported REST API development by assisting in implementation, testing, and system-level integration.

Environment: JAVA, Python, HTML, CSS, jQuery JavaScript, JSTL, JSP, AJAX, Microsoft SQL Server, Hadoop, Django, Junit.

Education

Masters in Computer Science -
University of Central Missouri

Bachelors in Information Technology-
JNT University, Hyderabad
